

## 01 Why does it matter?

The cost of interruptions—and the promise of automatic protection

# In today’s digital workplace, focus is constantly under attack.

Notifications, messages, and frequent context switching repeatedly interrupt computer - based work. Employees lose concentration, work less efficiently, and experience greater frustration - while employers lose valuable time, productivity, and work quality.

56

interruptions  
per workday

23 min

to regain  
deep focus

STRESS ↑

more frustration  
and time pressure

### THE PROMISE

A background agent that senses overload and protects the individual focus - automatically.

## 02 What did we build?

A working Windows agent that detects the moment protection is needed

KungFlow runs quietly in the background, monitors behavioral rhythm - not content - and changes the protection state only when overload is detected.

### NORMAL WORK · MONITORING IN THE BACKGROUND

Green state → no overload detected, so work continues normally

The user stays focused on the task while KungFlow quietly observes the work rhythm.

### OVERLOAD DETECTED · PROTECTION IS NEEDED

Red state → the server identifies overload and returns a protection decision

WITHOUT KUNGFLOW

WITH KUNGFLOW

Same overload, different outcome: without KungFlow interruptions continue; with KungFlow protection activates automatically.

## 03 How did we build it?

A personalized detection loop across the desktop agent, server and SQL storage

PROTECTION DECISION RETURNS TO THE AGENT

DEVELOPMENT & DEPLOYMENT
