

KungFlow

Focus that protects your people.

KungFlow senses cognitive overload in real time and quietly blocks interruptions — automatically. Healthier minds, deeper work.

Seed Round • 2026

Engineering

Why us? This problem sits exactly between attention, wellbeing, and software engineering - and so do we. We built KungFlow because notifications were burning our own working hours.

You're in the zone — then the pings hit

56

interruptions per workday

Pings, messages and alerts — one every ~9 minutes

23 min

to regain deep focus

After every single interruption (Mark, UC Irvine)

Stress up

the hidden price of pings

Interrupted work raises stress, frustration & time pressure (CHI '08)

Feel that for a second — your focus shattering. Now multiply it across every employee. That's what it costs the company.

It costs people. Then it costs money.

THE HUMAN COST

26% higher stress and lower job satisfaction among employees with more digital interruptions (Microsoft)

12B working days lost globally every year to depression & anxiety — a \$1T productivity bill (WHO)

Chronic interruption load is a direct driver of workplace stress and burnout.

THE BUSINESS COST — 250-PERSON COMPANY

\$30M total payroll for 250 employees, every year

~5% of it — \$1.5M+ — lost to interruptions (~2 hrs per person, daily)

Salary \$10K gross/mo · employer cost ~\$75/hr — money you already spend.

The good news: wellbeing pays. Every \$1 invested in employee mental health returns ~\$4 in health and productivity (WHO).

Plenty of fixes. None act in time.

Manual Do-Not-Disturb

Asks an overloaded brain to notice it's overloaded — exactly when it can't.

Time trackers (RescueTime, Toggl)

Report the damage after it's done. A speedometer, not a seatbelt.

Company focus-hour policies

One-size-fits-none. Not personal, not enforced, quietly resented.

Wellness apps (Calm, Headspace)

Lovely — but they live outside the workflow where the damage happens.

THE GAP

No tool detects overload and acts on it — automatically, in real time, with zero effort from the employee.

That's the product we built.

KungFlow — a firewall for your focus

1 · SENSE

Reads behavioral rhythm only — typing speed, window switches, mouse motion. Every minute, silently.

2 · UNDERSTAND

Scores cognitive load against your personal baseline. It learns what “normal” means for you.

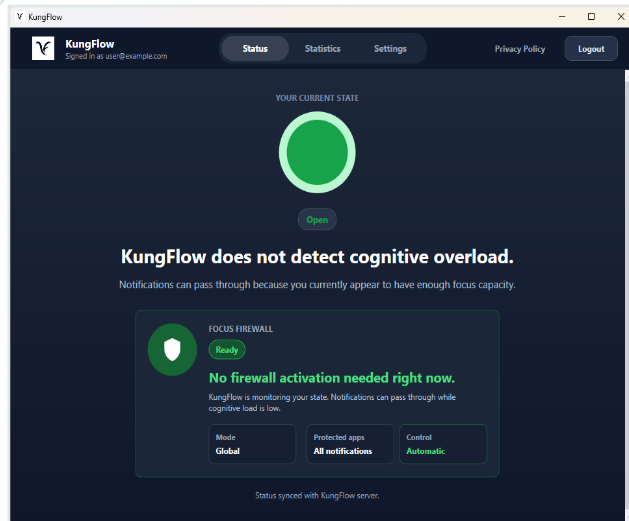

3 · PROTECT

Load exceeds 125% of baseline? DND on, WhatsApp & Outlook muted. Load drops? Everything back. Automatically.

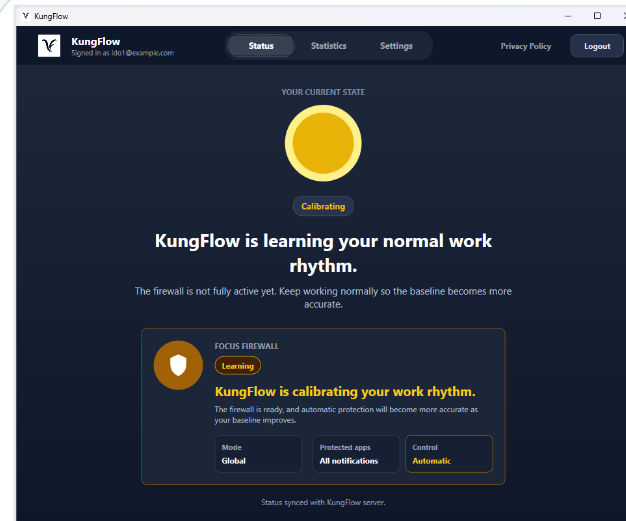

No buttons. No willpower. No new habits. The employee just works — KungFlow guards the door. Desktop agent (Windows) + Chrome extension, live today.

Live Windows protection states

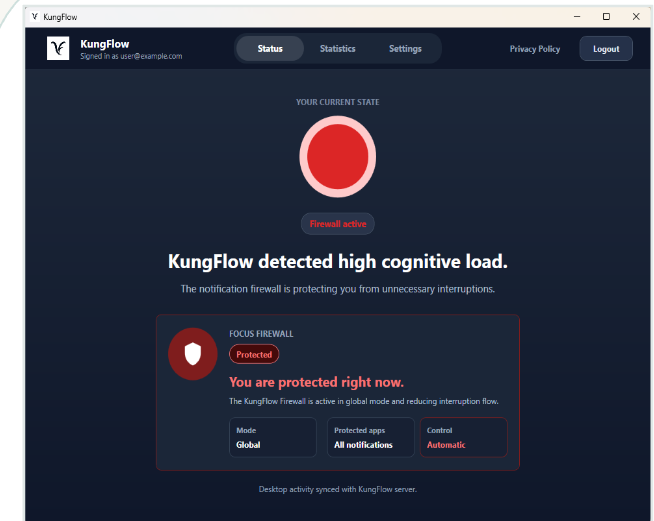

Open state

Low cognitive load: notifications can pass through.

Calibrating

KungFlow is learning the user baseline before full automation.

Firewall active

High load detected: the notification firewall protects focus.

A simple status experience makes the firewall visible: open when focus is stable, learning while calibrating, protected under high load.

Behavioral metadata becomes a load score

Mouse movement

Speed, acceleration, and micro-pauses help detect rising stress during real work.

Typing behavior

Typing rhythm, pace changes, and delete/backspace use reveal friction without storing content.

App switching

Window switching and visible app count show context switching and attention fragmentation.

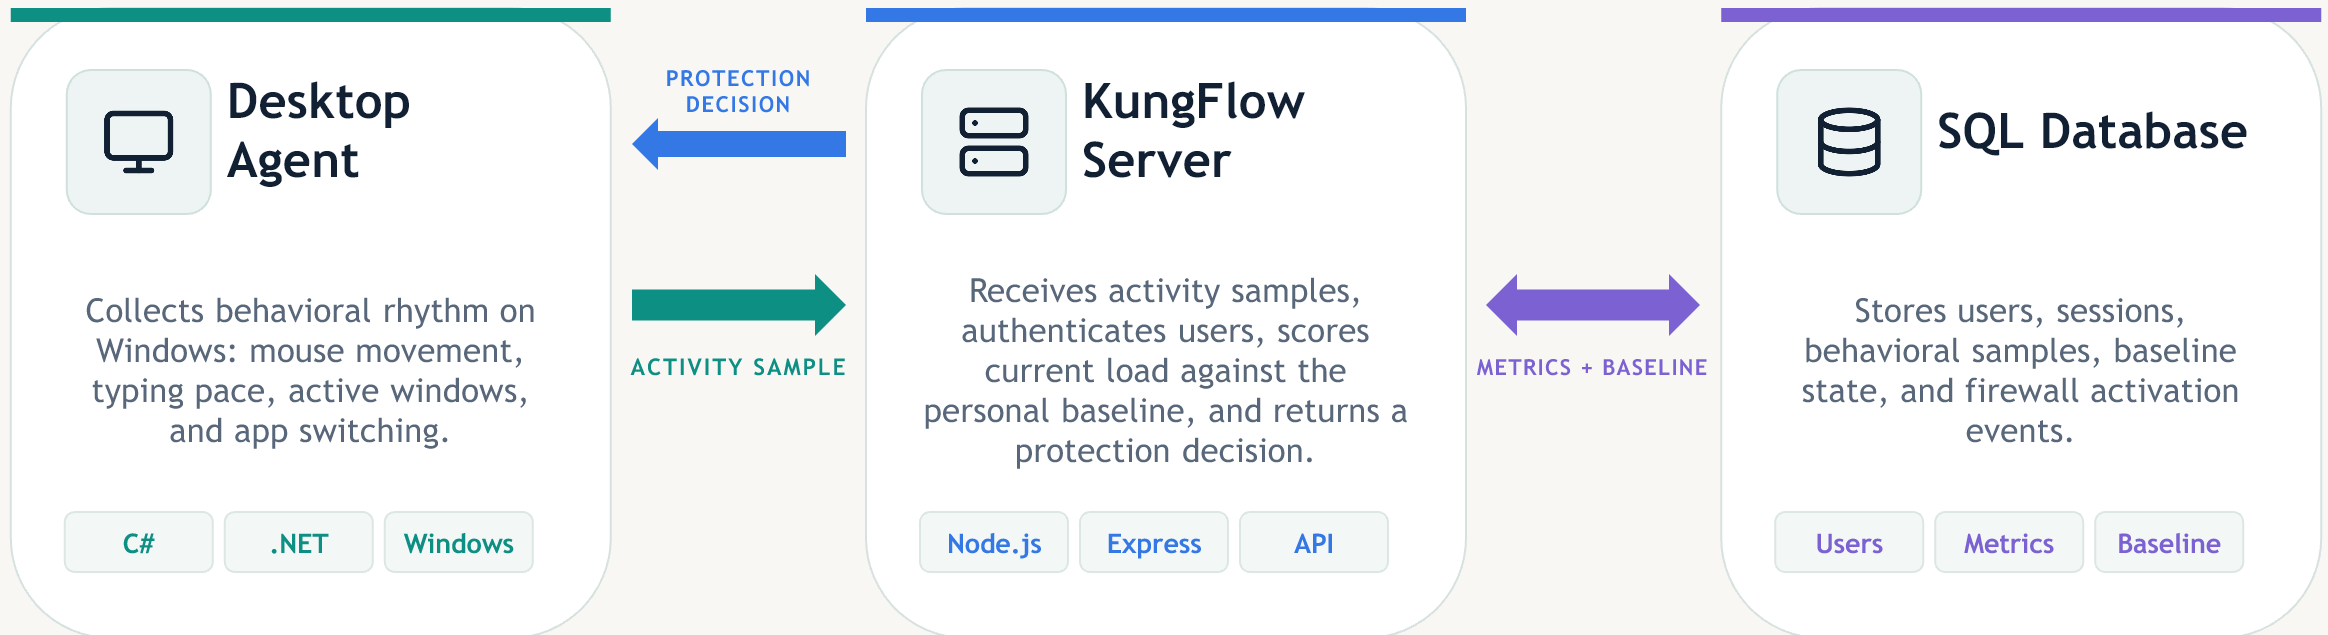

Score = weighted behavior signals compared with the user baseline

When current load rises above the adaptive baseline, KungFlow activates the firewall. Only behavioral metadata is stored - never typed content, screenshots, documents, or websites.

How did we build it?

A lightweight client-server loop connects the Windows agent, the scoring backend, and SQL storage.

The agent never sends content. It sends metadata samples, the server computes state, and the firewall decision returns to the desktop in real time.

Not surveillance. The opposite.

KUNGFLOW NEVER SEES

- ✗ What you type
- ✗ Websites you visit
- ✗ Documents you open
- ✗ Screenshots — of anything, ever

IT ONLY SENSES RHYTHM

- ✓ Typing speed & window switches — signals your OS already has
- ✓ All signals are anonymized and aggregated — managers see team trends only, never an individual's score.
- ✓ Every employee can pause data collection. One toggle, no questions.

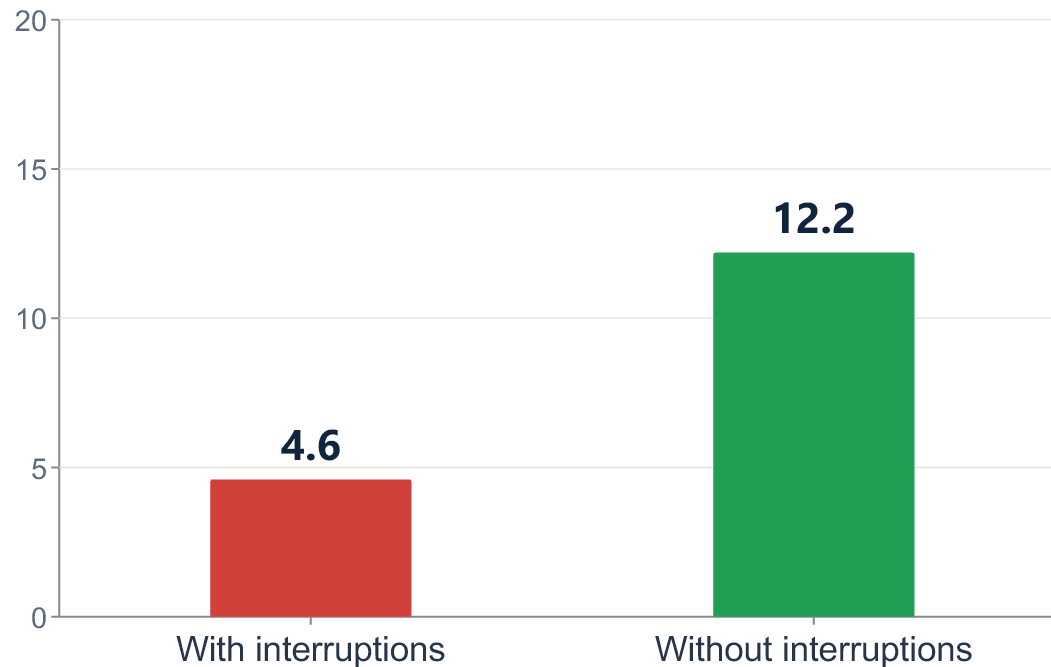

56% vs 40%

of digitally monitored employees feel tense or stressed at work, compared to non-monitored peers (APA, Work in America 2023).

Surveillance backfires. So we flipped the model: the data belongs to the employee and works for the employee. KungFlow is a perk, not a watchdog.

We tested it. Focus won.

Task accuracy — error-correction task, score out of 20

+165%

better task scores once interruptions were removed

49%

fewer errors missed in the same 10-minute window

+25%

net gain after controlling for natural learning effects

Controlled pilot, n=8, with a learning-effect control group (2026). Larger study planned with design partners.

The math for one 250-person company

\$1.5M

recovered at just 5% of payroll

vs

\$90K

for KungFlow — 0.3% of payroll, all 250 seats

=

16 : 1

return on every \$1 spent — and you add no real spend

AND FOR EVERY SINGLE EMPLOYEE

~2 hrs

of deep work back, daily

56 → quiet

interruptions blocked at the right moment

Calmer days

less stress, lower burnout risk

A big problem — and an empty category

M12

10 companies · 2,500 users · \$900K ARR · break-even

Covers 12 months of operations (\$550K deficit) + 3-month buffer. One goal: 10 mid-market companies.

Product-led growth: free spreads, value sells

1 • ADOPT

Free, bottom-up

Individuals install the free tier and get real focus value — zero friction, no buyer needed. It spreads desk to desk.

2 • CONVERT

Free → Team

Power users self-upgrade for the adaptive baseline and all their apps. Pure self-serve — no salesperson in the loop.

3 • EXPAND

Team → Business

Managers see their team already using it and buy team analytics, admin and custom rules. Light sales-assist.

4 • STANDARDIZE

→ Enterprise

HR and IT roll it out org-wide — SSO, burnout analytics, dedicated CSM. Top-down lands on bottom-up demand.

Free does the selling. The product expands itself up the org chart — low CAC, fast payback, and it compounds as every free user pulls the next one in.

How we reach companies

PHASE 1 · M1-3

Design partners

2 companies from our own network, installed free — in exchange for feedback and case-study rights.

PHASE 2 · M4-6

Founder-led sales

We sell directly. LinkedIn outreach to VP R&D and VP People at Israeli tech, 100–500 employees.

PHASE 3 · M6-12

Scale outbound

First SDR at M6. 40 sequences/week. Public case study at M9 with measured results.

THEN

Expand outward

Land & expand inside each account, then US via Israeli logos with US offices, then Europe (GDPR).

Why Israel first: warm founder network, demanding early adopters, and short sales cycles keep CAC low — and Israeli logos open doors in the US.

Thank you.

Let's give people their focus back.
